

Cockpit Bracing for Underseat Bins

Cockpit bracing bars of anodized aluminum looking aft to port.

Looking forward, note "U" shape of forward socket which allows bar to be removed.

Detail of aft socket, hole in HDPVC was shaped to match profile of bar.

I've tried a lot of different solutions to shifting bins under the seats. This seems to do the job just fine. Even when the boat is over 60 degrees all is secured. I have the same setup on the starboard side also. The bars are anodized closet bars that come in 8' lengths. I got mine at an RV supply house, but I recall seeing them in home centers too.
