

Sea Prompt's Harken Single Line Reefing system.

This is the hardware mounted on the boom.

Whiit line with green spots is reefing line. It fastens to the padeye at the bottom of the device, loops under the boom to the starboard side goes thru the reefing cringle, and comes back down on the port side. It is lead thru the turning block forward to the mast block mounted on the port side of the mast.

These are the mast blocks.

The (white with green spots) reefing line is lead thru the port mast block up through the reefing cringle on the port side and down through the triple

bloc at the base of the mast on the starboard side.

This is the deck organizing system.

The reefing line (white with green spots) is lead from the triple block to the triple deck organizer to the triple rope clutch.

Note that the bail to which the triple block is attached is welded onto the tabernacle. You must use inert gas welding for stainless steel.
